Hello, my name is Lucas and I'm from Zaragoza in Spain, and I'm going to tell you an amazing idea.

A few days ago, our teacher Diego asked us to think about current problems in Europe that we were concerned about.

So one afternoon together with my friends we decided to take action, we met up one afternoon and we thought about a specific topic. And from that issue, we thought of a series of measures that the European Union should implement.

Obviously they are under the competence of the European Union. What, you come with me, I tell you the topic, the measures and introduce you to my friends? if so, let's go!

Selected topic

The theme we have come up with is Promoting Digital Education and Technology Inclusion to improve digital education and ensure technology inclusion in all communities across the European Union. After this I will launch the first measure.

Development of Digital Infrastructures. EU Competences: Regional Policy and Cohesion.

Our measure is that the EU should invest in the improvement of digital infrastructures in all communities of the European Union, to ensure equitable access to high speed connectivity.

How do we plan to do this?

By carrying out a detailed mapping of the current connectivity in all EU communities to identify those areas of the communities across the EU to identify those areas where there is a poor digital infrastructure

Establish tax incentives for service providers who decide to invest in improving digital infrastructure in these underserved areas.

Fair Access to Digital Devices and Resources EU Competences: Internal Market and Consumer Protection

The measure envisaged would be to establish fair pricing policies so that no student in the European Union would be left behind in their education process.

How do we plan to do this?
We could do this by setting up a subsidy programme for low-income families so that they can buy digital devices.

We could also negotiate with companies to be able to provide digital licensing to be able to provide more affordable digital licenses for vulnerable low-income families. Vulnerable low-income families.

Awareness raising campaigns on online security EU competences: Justice and fundamental rights.

Our measure is the European Union's leadership on campaigns to protect young people in online safety and young people in cyber security.

How do we plan to do this?

By collaborating with civil society organizations and companies to promote campaigns which talk about the dangers online.

And also interactive online resources where they promote and teach about cyber dangers.

International Collaboration for Research and Technological Development EU Competences: Research and Innovation.

Our action is to promote collaboration between European Union member countries to foster European Union to foster innovation and technological development by sharing resources and knowledge.

How will we do this?

Through the creation of collaborative platforms by setting up web pages where non-profit organizations where not-for-profit organizations, educational institutions and technology companies collaborate on innovation projects.

And with funds for pilot projects with the aim of investing in projects with emerging technologies in educational settings.
